From setting up your environment to writing your first Windows application, this article aims to be a detailed resource for developers, students, and enthusiasts who want to dive deep into Windows 2000 programming with a Schildt-inspired perspective.

Understanding the Foundations: Herbert Schildt's Programming Philosophy

Before diving into Windows 2000 specifics, it's essential to understand the core principles that Herbert Schildt emphasizes in his programming literature:

- Clarity and Simplicity: Schildt advocates for clear, understandable code that emphasizes fundamental concepts over complex, opaque implementations.
- Structured Programming: Emphasizing logical flow, control structures, and modular design.
- Hardware and OS Awareness: Understanding how software interacts with hardware and the operating system to write efficient and effective programs.
- Practical Application: Focusing on real-world coding scenarios, especially in system programming and GUI development.

These principles serve as a sturdy foundation when approaching Windows 2000 programming, which involves both system-level API interactions and user interface management.

Setting Up Your Development Environment for Windows 2000 Programming

To develop Windows 2000 applications inspired by Schildt's teachings, you need a suitable environment:

- Choosing the Right Tools

- Microsoft Visual Studio: The most common IDE for Windows development during the Windows 2000 era. Visual Studio 6.0 or earlier versions are compatible.
- Windows SDK: Ensure you have the Windows 2000 SDK installed, which provides headers, libraries, and documentation.
- Compiler: Use Microsoft's C or C++ compiler provided within Visual Studio.

- Configuring Your Environment

- Install Visual Studio with Windows SDK.
- Set up project templates for Win32 applications.
- Familiarize yourself with the Windows API documentation, especially focusing on window creation, message handling, and resource management.

Core Concepts in Windows 2000 Programming

- The Windows API

Windows 2000 programming heavily relies on the Windows API (WinAPI), a comprehensive set of functions for managing windows, messages, files, and system resources. Schildt emphasizes understanding the API at a fundamental level:

- Message-driven architecture: Windows applications respond to messages such as WM_PAINT, WM_CLOSE, WM_COMMAND.
- Handle-based resource management: Windows uses handles (HWND, HINSTANCE, HICON) to manage resources.

- The WinMain Function

Every Windows application begins with the `WinMain` function, which initializes the application and enters the message loop.

```
```cpp
```

```
int WINAPI WinMain(HINSTANCE hInstance, HINSTANCE hPrevInstance,

LPSTR lpCmdLine, int nCmdShow) {
```

```
// Register window class, create window, message loop
```

```
}
```

```
...
```

Schildt's approach involves clearly understanding each step: registering window classes, creating windows, and handling messages.

- Registering and Creating Windows

- Register a window class with `RegisterClassEx``.
- Create a window with `CreateWindowEx``.
- Show and update the window with `ShowWindow`` and `UpdateWindow``.

- Message Loop and Window Procedure

The core of any Windows app is its message loop:

```
```cpp
```

```
MSG msg;
```

```
while (GetMessage(&msg, NULL, 0, 0)) {
```

```
    TranslateMessage(&msg);
```

```
    DispatchMessage(&msg);
```

```
}
```

```
...
```

The window procedure handles messages:

```
```cpp
```

```
LRESULT CALLBACK WndProc(HWND hwnd, UINT msg, WPARAM wParam, LPARAM lParam) {
```

```
switch (msg) {

case WM_DESTROY:

 PostQuitMessage(0);

 break;

// Handle other messages

default:

 return DefWindowProc(hwnd, msg, wParam, lParam);

}

return 0;

}
```

## Practical Windows 2000 Programming: Building a Basic Window Application

### Step-by-step Guide

- Define the Window Class: Set up the `WNDCLASSEX` structure, specifying styles, icons, cursor, background brush, and window procedure.
- Register the Class: Use `RegisterClassEx`.
- Create the Window: Call `CreateWindowEx` with the class name and window title.
- Show and Update: Use `ShowWindow` and `UpdateWindow`.
- Enter the Message Loop: Process messages until `WM_QUIT` is received.
- Handle Messages: Inside `WndProc`, respond to user actions or system events.

### Example: A Simple "Hello World" Window

```
```cpp
```

```
include
```

```
LRESULT CALLBACK WndProc(HWND, UINT, WPARAM, LPARAM);

int WINAPI WinMain(HINSTANCE hInstance, HINSTANCE hPrevInstance,
LPSTR lpCmdLine, int nCmdShow) {

WNDCLASSEX wc = { sizeof(WNDCLASSEX) };

wc.style = CS_HREDRAW | CS_VREDRAW;

wc.lpfnWndProc = WndProc;

wc.cbClsExtra = 0;

wc.cbWndExtra = 0;

wc.hInstance = hInstance;

wc.hbrBackground = (HBRUSH)(COLOR_WINDOW+1);

wc.lpszClassName = TEXT("MyWindowClass");

wc.hCursor = LoadCursor(NULL, IDC_ARROW);

wc.hIcon = LoadIcon(NULL, IDI_APPLICATION);

RegisterClassEx(&wc);

HWND hwnd = CreateWindowEx(

0,

TEXT("MyWindowClass"),

TEXT("Herbert Schildt Windows 2000 Programming"),

WS_OVERLAPPEDWINDOW,

CW_USEDEFAULT, CW_USEDEFAULT,

500, 400,
```

```
NULL, NULL, hInstance, NULL);

ShowWindow(hwnd, nCmdShow);

UpdateWindow(hwnd);

MSG msg;

while (GetMessage(&msg, NULL, 0, 0)) {

    TranslateMessage(&msg);

    DispatchMessage(&msg);

}

return (int) msg.wParam;

}

LRESULT CALLBACK WndProc(HWND hwnd, UINT msg, WPARAM wParam, LPARAM lParam) {

    switch (msg) {

    case WM_DESTROY:

        PostQuitMessage(0);

        break;

    default:

        return DefWindowProc(hwnd, msg, wParam, lParam);

    }

    return 0;

}

...

```
